

SCRUB-N-GO Bio-Enzymatic Floor Cleaner

Ideal for Commercial Kitchens, Restaurants, Hotels and more...

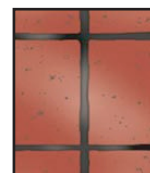

Commercial kitchens tend to accumulate grease and organics on floors. These soils are ground into pores, cracks, and crevices by constant foot traffic and rolling carts and equipment. It is difficult for detergents to penetrate this built-up layer of embedded grime. In addition, emulsified grease that remains in the wash water tends to form a polymeric coating on floor surfaces contributing to slip hazards. Embedded organic soils tend to develop malodors and can support unwanted insects and bacteria.

Two-Laq's latest technology for floor cleaning, **SCRUB-N-GO**, specifically targets the removal of greasy soils with three-way action. Initially, patent-

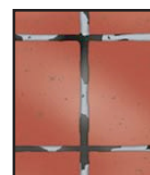

Three-way action gives

superior cleaning capability
for commercial kitchen floors

pending surfactant technology lifts greasy surface soils for easy removal. Re-

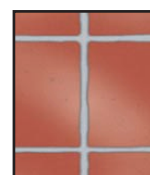

sidual organics are then attacked by a proprietary blend of bioenzymatic actives including a strain patented for its ability to degrade the most resistant grease particles, the long-chain fatty acids. It's the third technology that makes this cleaner so unique. A special lipase enzyme breaks down grease and embedded soils into smaller particles for faster emulsification and digestion. Each application removes layers of embedded soil.
